## Abstracts

Upright bagless vacuum cleaners can reduce physical exertion during cleaning by rotating and turning. The vacuum cleaner is equipped with an electric extractor fan. There is a wind impeller on the rotating shaft of the exhaust fan, which generates strong suction and pressure after power-on. Under the action of suction and pressure, the air is discharged at a high speed, and the air in the suction part of the front end of the fan continuously replenishes the air in the fan, resulting in the inside of the vacuum cleaner. An instantaneous vacuum is generated, and a negative pressure is formed with the external atmospheric pressure to complete the cleaning work. The easy-to-empty garbage bin can replace traditional garbage bags and is more environmentally friendly and convenient.
