Ureteroscope is a medical device, which is thin tube like device with illuminating light and lens to capture images of complex urinary tract organs for the presence of calculi or tumors. It is passed through the urethra to the bladder and then into the ureter for the diagnosis and treatment of kidney stones. The device helps to understand the position of the kidney stone and also in treatment of kidney stone removal. It is a minimally invasive procedure to remove the kidney stone and has shown higher accuracy and least rate of complications when compared to traditional methods of kidney stone removal such as extracorporeal shock wave lithotripsy (ESWL), percutaneous nephrolithotomy (PCNL) etc. Kidney stone can either be removed by using basket attached to the ureteroscope or it can be broken down into fragments which are excreted through urine outside the body.
