Abstracts

User virtualization is connected to the concept of desktop virtualization where the desktop environment is a virtual machine stored on a remote server. The key thing here is that there are two kinds of virtualized desktop infrastructure (VDI): Persistent and non-persistent VDI. Persistent VDI means that the virtual image on the user's desktop can be personalized with the addition of data, shortcuts, files, etc. Every time the user logs into the virtual machine, the image reflects changes made earlier. Non-persistent VDI is the opposite of that: Every time a user logs out, the computer reverts to its original state and the user sees the same image every time he or she logs in. The advantages of non-persistent images are that they are much easier to manage, require less storage, and are easier to patch and update.
