## Abstracts

A vacuum degreaser extracts all the air out of the system and seals off the work chamber from ambient atmosphere, thus no operators are exposed to any fugitive emissions. The work is processed in a sealed chamber so no solvent is lost during processing.

Then, due to the vacuum, the boiling point of the solvent is lowered so it will boil and vaporize at a lower temperature. Therefore, less energy is used to heat the chemistry, which results in energy savings (smaller carbon footprint).

With the air removed (when the work chamber is filled with solvent and parts are immersed), the ultrasonics are more efficient in impinging on the parts due to no interference by air in the chemistry as with a typical open-top degreaser. Enhanced ultrasonics activity equals enhanced cleaning.
