Vacuum emulsifying refers to the raw material being in a vacuum state, uses high-shear emulsifier to distribute one or more phases to another continuous phase quickly and evenly, by using the strong kinetic energy of mechanical, the material bears hundreds of thousands of times of hydraulic shearing in every minute in a narrow space of stator and rotor. Under the comprehensive effect of centrifuging, extruding impacting and tearing, the material is dispersed and emulsified instantly and evenly, and finally get no bubbles and fine stable high-quality products after the high-frequency cycle.

Vacuum emulsifying machine is mainly consisted of pretreatment pot, main pot, vacuum pump, hydraulic pressure system, electrical control system and so on. The material of water pot and oil pot will be sucked into the main pot to mix, homogenous and emulsify after they have been fully dissolved.
