Abstracts

Vasoconstrictor medicines belong to a class of drugs known as pressor drugs because they raise arterial pressure. These medications induce blood vessels to constrict by contracting the smooth muscle in the vessels. Because mean arterial pressure is determined by the product of systemic vascular resistance and cardiac output, constriction of arterial vessels raises systemic vascular resistance, which leads to a rise in arterial blood pressure. The Frank-Starling mechanism, which increases arterial pressure, increases venous blood pressure and increases cardiac preload and cardiac output when venous arteries are constricted.
