When the control and improvement of the engine reaches a certain emission level, the catalytic converter is necessary to meet further strict emission regulations. Usually the catalytic converters used in gasoline and diesel engines are different. The early catalytic converters of gasoline engines were only two-effect (two-bed), that is, only CO and HC were processed. With the stricter emission regulations and restrictions on NO_x in various countries, three-way catalytic converters (three-way catalytic converters) are now used. When the exhaust gas passes through the catalytic converter, under the catalysis of these catalysts, CO and HC undergo a chemical reaction with O₂ (called an oxidation reaction), so that HC generates H₂O, CO becomes CO₂, and NO_x is reduced to O₂ and N₂.
