Abstracts

Magnetic resonance imaging (MRI) is a sophisticated 3D imaging technique, which has been a widely used clinical diagnostic tool over the last two decades. MRI measures and records changes in the magnetic property of protons present in the cellular water. Unlike X-rays, MRI does not require the use of ionizing radiation. For imaging, an MRI device uses radio waves and the magnetic field such as pulsed electromagnetic field in order to excite protons present in the area of interest. In developed regions/countries such as the U.S. and Europe, 7 Tesla and 11 Tesla MRI are among the widely used imaging techniques. Veterinary MRI is now seen as a gold standard technique for brain and spinal examination of animals with spinal disk herniation, trauma of the brain and spine, brain tumors, strokes, and brain malformations. Additionally, MRI is seen as a powerful technique for examining tendon- and ligament-related ailments. In case of chronic wounds and draining tracts, MRI imaging helps identify foreign bodies within the wound. This has effectively contributed in increasing the market for veterinary MRI systems in various applications segments.
