The traditional method of data delivery and network services takes place through hardware devices. However, virtual customer premise equipment, on the Others hand, does not use any specific hardware. It rather uses software and virtualization tools to replicate services such as routing, security in the firewall, and also virtual private network. The enterprises are heavily benefitted from virtualization as it improves the delivery of network service, allows for remote connectivity, and tends to be low on maintenance. Many enterprises are also benefitted from the network traffic load distribution.
