Abstracts

A virtual private network (VPN) extends a private network across a public network, and enables users to send and receive data across shared or public networks as if their computing devices were directly connected to the private network. ('In the simplest terms, it creates a secure, encrypted connection, which can be thought of as a tunnel, between your computer and a server operated by the VPN service.') Applications running across the VPN may therefore benefit from the functionality, security, and management of the private network. It can establish a private network on the public network and carry out encrypted communication. It is widely used in enterprise network. VPN gateway achieves remote access through encryption of packets and translation of packet target address. It mainly uses tunneling technology, encryption and decryption technology, key management technology and user and equipment identity authentication technology.
