In heavy oil, the content of light components is low, the content of asphaltene and colloid is high, and the content of straight chain hydrocarbon is low. As a result, most heavy oil has the characteristics of high viscosity and density, which makes it difficult to mine and transport. The main components of emulsifying agent are surfactants. By reducing the oil-water interfacial tension, the heavy oil in the formation changes from oil-in-water emulsifying state to water-in-external emulsifying state, which greatly reduces the viscosity of heavy oil and significantly increases the recovery rate.
