Abstracts

Volatile Organic Compounds are lighter compounds of crude, which get evaporated during loading operations or when carrying high-volatility crude. The vapor in the cargo needs to be vented out into the atmosphere to restrict any pressures in the tank, which could reach dangerous limits. Volatile organic compounds needs to be recovered and emitted into the atmosphere in large volumes during the loading of oil shuttle tankers from the oil field. The recovery of these volatile organic compounds are done with the help of system known as volatile organic compounds recovery systems. Benefits of utilizing volatile organic compounds recovery systems are that volatile organic compounds, if recovered systematically, can be reused, which saves money. Volatile organic compounds recovery systems are likely to restrict emission of harmful gases in the environment when used efficiently.
