## Abstracts

Wafer level packaging inspection machines are used to detect pattern defects and physical defects on the wafer. These defects are usually divided into system defects and random defects. Random defects are mainly caused by particles attached to the surface of the wafer, so the spots cannot be predicted. On the other hand, the conditions of the mask and exposure process can cause systematic defects. According to its working principle, wafer inspection machines are divided into patterning machines and non-patterning machines.
