Abstracts

Wavemeters are interferometers used to measure wavelengths of laser beams. The devices are mounted on benches or desktops. They generate numerical values identifying pulsed and continuous wave lasers. Wavelength meters deliver reliable monitoring of tunable and diode lasers. They enable calculations of improved validity compared with spectrometers or grating monochromators. These measurements range from 0.01 nm to hundredths of a picometer. The components monitor wavelengths attributable to tunable lasers or lasers experiencing wavelength drift without the necessity of complicated long-path methods applied with spectrometers.
