Abstracts

WAN optimization provides a range of features to improve the performance of applications running across the WAN; and reduce the cost of the WAN. The range and scope of features supported by WAN optimization solutions continue to evolve, typically in support of three high-level needs - improving the response times as experienced by users of business-critical applications over WAN links or mobile connections, often addressing application performance problems caused by bandwidth constraints, latency or protocol limitations; assisting in maximizing the ROI for WAN bandwidth, and delay costly bandwidth upgrades; and in optimizing data-center-to-data-center (DC-to-DC) traffic for faster replication and synchronization.
