A wire crimping machine tool is simply a device that is used to bind two pieces of metal by distorting either or both of the metals, which is most often a wire, in a manner such that they are held together. A typical example of an application of wire terminal crimping is the process of joining a connector to the end of a cable, for instance, in the telecommunications industry, the crimping tool is used in joining network cables as well as phone cables.

The terminal crimping machine is related to a machine used for processing wires, whether commercially or for private use. It is also named wire crimping machine. The mode of operation of the crimping machine is that it basically applies pressure on the hardware head (the connector) and joins it to the wire end and then conducts it. The wire ends that are crimped by the terminal machine are often much more suitable for connection. The two joined wires are firmly bound together even without soldering and this makes it easy to be disbanded and separated when disassembling.
