Abstracts

Zero liquid discharge (or ZLD) is a type of wastewater treatment technique, wherein almost all of the wastewater generated is recycled and purified. This eliminates discharge of any liquid at the end of the process, resulting in zero discharge of water. The zero liquid discharge wastewater treatment comprises several processes such as reverse osmosis, ultrafiltration, fractional electrode ionization, and evaporation & crystallization. A well-designed, efficient, and effective zero liquid discharge wastewater treatment system should be capable of handling any fluctuations in waste contamination and flow rate and capable to recover around 95% to 99% of water for reuse.
