A software-defined perimeter (SDP) is a way to hide Internet-connected infrastructure (servers, routers, etc.) so that external parties and attackers cannot see it, whether it is hosted on-premises or in the cloud. The goal of the SDP approach is to base the network perimeter on software instead of hardware. A company that uses an SDP is essentially draping a cloak of invisibility over their servers and other infrastructure so that no one can see it from the outside; however, authorized users can still access the infrastructure.
