Abstracts

The days of trying to secure IT systems by simply adding ever more security products are over. Procurement and operating costs and insecurity driven by complexity have ended their reign. Security professionals have recognised that security has to be incorporated at all levels, from the foundation infrastructure to the business processes. Fortunately, this approach is consistent with meeting financial pressures to contain IT costs and improve and rationalise business efficiency where the procurement of security technology is concerned.

Contents

Executive summary

In a nutshell

Key messages

Security is more effective when integrated into the ecosystem

Security should be integrated with both the IT infrastructure and the business processes

Price pressure is emphasising the need for integration

Security is central to enterprise IT

Security needs to be built into systems and processes

Securing cloud-based applications and data

The security budget is finite and tightening

Integrating security into the ecosystem

Two complementary approaches

The COBIT model

Business process integration

Risk-driven security

Anti-fraud

Identity management and access control

Application security

Integrating security into the infrastructure

The Microsoft trusted stack

Virtualisation

Encryption and key management

DLP/email demonstrates the need for business configuration even at the infrastructure level

Browser security

Removable media

Data storage systems and compliance

Market impact

Security demands just keep on growing

Vendors can't do what they want

Disruptive effects on vendors
