Abstracts

Tissue engineering involves biomaterial development and practice of combining cells, scaffolds and biologically active molecules into fully functional tissues and organs, for implantation in the living beings. This technology is used for making reconstructive implants that are used for replacing malfunctioned tissues and organs. Tissue engineered medical devices being more bio-compatible in comparison to artificial implants are preferred for treatment surgeries. Moreover, lower probability of rejection by human autoimmune system is also boosting its adoption among the physicians and patients requiring implants.

According to Pharmaion report, “Global Tissue Engineered Medical Devices Market Forecast & Opportunities, 2020”, global tissue engineered medical devices market is anticipated to surpass US\$ 26 billion by 2020 on account of increasing prevalence of diabetes, aging population and increasing demand for tissue engineered medical devices over artificial implants. North America dominated the global tissue engineered medical devices market in 2014, and is anticipated to continue its dominance through 2020 as the percentage of geriatric population is very high in this region. Moreover, the economic stability of the region also helps patients to undergo expensive treatment options. Few of the leading companies operating in global tissue engineered medical devices market include Medtronic plc, Stryker Corporation, Zimmer Biomet, Edwards Lifesciences Corporation and Depuy Synthes, among others. “Global Tissue Engineered Medical Devices Market Forecast & Opportunities, 2020” report elaborates the following aspects of global tissue engineered medical devices market:
