Abstracts

The 8 bit microcontroller is a stand alone system with memory, processor, and peripherals that can be used as a embedded system. Most programmable 8-bit microcontrollers currently in use are embedded in other mechanical or consumer products, including telephones, automobiles, home appliances, and peripherals for computer systems. Therefore, another name for the 8-bit microcontroller is 'embedded 8-bit controller' . Some of the embedded system are very complex, while others are less complex and require very little memory and programming length, embedded system said. Input and output devices include relays, solenoids, switches, LCD displays, and data sensors such as temperature, light level, or humidity sensors.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the 8Bit Microcontrollers market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.

The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among the population, and uncertainty about future.
