## **Abstracts**

An autonomous data platform is a big data infrastructure that both manages and optimizes itself. It also learns how to do both of those things better by watching how you use your data platform. It watches what kind of queries you run, which tables you use, how many clusters you're building, and how efficiently you are using those clusters. In short, an autonomous data platform examines everything related to how your big data infrastructure is used to solve business challenges, and it analyzes that information to help you make improvements.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
