Abstracts

Boron nitride coating is a white, tasteless, and silty liquid. It is an inert, inorganic, high-temperature lubricating material. It does not bind or soak molten metal, therefore, it can be used to protect and melt the surfaces of aluminum, magnesium, zinc alloys and refractory or ceramic vessels that have direct contact with the molten slag, thus extending the service life of such vessels. Boron nitride coatings are usually composed of boron nitride, water and a small number of other additives, and can be completely soluble in water. As a result of this property, boron nitride coatings are widely used in aluminum, magnesium, zinc alloy casting, gravity low-pressure casting, forging, powder metallurgy, and other fields. It is usually painted on the surface of the flow trough, casting table lining, distribution flow trough, filter box, transfer plate, skimmer, casting nozzle material, pouring ladle, etc. This will protect the mold from corrosion and thus extend the service life of the refractory, but also in the production process, to prevent fine impurities from penetrating into the liquid metal, resulting in secondary pollution, and thus greatly improve product quality. And boron nitride coating technology in the high-temperature environment also has excellent lubrication and oxidation resistance, non-stick, anti-jamming and metal or graphite corrosion oxidation and other properties. Moreover, it can be used not only to protect refractory but also to resist corrosion and sticking.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
