Abstracts

Cell-Site Simulators or IMSI Catcher (an international mobile subscriber identity-catcher), refers to a type of electronic surveillance equipment that collects information about nearby mobile devices. This is done either passively, by intercepting the radio signals already being transmitted between a mobile device (such as a mobile phone) and a mobile base-station (cell tower); or actively, by presenting itself to nearby mobile communication devices as a legitimate mobile base-station, thereby fooling devices to connect to the IMSI-catcher itself allowing further interception of information from the devices.

The Cell-Site Simulators or IMSI Catcher industry was 96 million USD in 2018 and is projected to reach USD 192 million USD by 2025, at a CAGR (Compounded Annual Growth Rate) of 9.63% between 2019 and 2025. The IMSI catcher first emerged in the early 1990s. Over the past decade, a series of lawsuits was filed in connection with IMSI catcher use and civil rights organizations and journalists began to ask questions. Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Cell-Site Simulators market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.

The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among the population, and uncertainty about future.
