Chemotherapy-Induced myelosuppression is defined as the decreased ability of the bone marrow to produce blood cells (WBC, RBC and platelets). It occurs most commonly in cancer patients as an adverse effect of chemotherapy drugs, especially in case of cancers that are located near the bone marrow or near large bones with cavities.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
