## **Abstracts**

Cholinesterase inhibitors (also called acetylcholinesterase inhibitors) are a group of medicines that block the normal breakdown of acetylcholine. Acetylcholine is the main neurotransmitter found in the body and has functions in both the peripheral nervous system and the central nervous system. For example, acetylcholine is released by motor neurons to activate muscles; acetylcholine also has an important role in arousal, attention, learning, memory and motivation.

Cholinesterase inhibitors block the action of the enzyme cholinesterase, which is responsible for breaking down acetylcholine. This increases levels of acetylcholine in the synaptic cleft (the space between two nerve endings).

The main use of cholinesterase inhibitors is for the treatment of dementia in patients with Alzheimer's disease. People with Alzheimer's disease have reduced levels of acetylcholine in the brain. Cholinesterase inhibitors have been shown to have a modest effect on dementia symptoms such as cognition.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Cholinesterase Inhibitors market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.

The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among the population, and uncertainty about future.
