A Detector Logarithmic Video Amplifier (DLVA) consists of a detector followed by a logarithmic video amplifier (LVA). The detector converts the RF energy into a DC voltage which is then amplified by an amplifier with a logarithmic transfer function. A DLVA converts an RF signal with a large dynamic range into a video signal/voltage with a smaller dynamic range. The output voltages can then be displayed on a screen. The basic configuration of a DLVA is a detector (Schottky barrier diode or a zero bias tunnel diode) followed by a logarithmic video amplifier (LVA). The detector detects the pulse or CW signal and produces a video signal (i.e Voltage), which is fed into the LVA and amplified logarithmically. The LVA transforms the scale of the video signal from a linear scale to a logarithmic scale in order to observe the RF signals with a wide amplitude range. DLVA is ideal for applications such as phased array radar receivers, passive direction finding receivers (such as radar warning receivers) and channelized receivers. Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Detector Log Video Amplifiers market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
