Abstracts

A dew point analyzer measures the amount of moisture present in a gas to determine the theoretical temperature at which the moisture in the gas will condense (the saturation point). Although dew point is related to the temperature and the pressure of the gas, the dew point of a gas remains the same regardless of the actual temperature of the gas. For example, a gas at room temperature (70°F, or 21.1°C) with a dew point of 40°F (4.4°C) will cause condensation if it is cooled to a temperature below 40°F. This can be seen in the summer when the ambient temperature in the evenings drops below the dew point temperature of the air, causing water droplets to form on any surface that cools to a point below the dew point temperature. Knowing the dew point of a gas in a heat treating environment can be beneficial in either determining the carbon potential of the gas, or determining the purity level of the incoming process gases. Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Dew Point Analyzer market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
