Abstracts

Diabetes mellitus (DM), commonly known as diabetes, is a group of metabolic disorders characterized by high blood sugar levels over a prolonged period.

There are two predominant types of diabetes. Type 1 diabetes patients are typically diagnosed in childhood, and their bodies are not able to produce insulin. Type 1 accounts for less than 10% of diabetes patients, but the smaller population doesn't equate to minimal revenues. Synthetic insulin, the go-to treatment for type 1 diabetes, can also be prescribed to type 2 diabetes patients not responding to other treatments. Type 2 diabetes is more common and differs from type 1 because the body produces insulin but isn't able to process it correctly. Patients are typically diagnosed over the age of 30, there tends to be a genetic predisposition, and obesity is closely related to this type.
