Abstracts

An oscillator that uses a Dielectric Resonator as the frequency determining element, to produce signals with excellent signal stability, high Q and very low micro-phonics is called as Dielectric Resonator Oscillator (DRO). The resonant frequency of a DRO depends upon the physical dimensions of the dielectric material used, its shape - rectangle or disc and its dielectric constant.

The frequency of these oscillators is generally fixed but slight mechanical or electrical tuning can be achieved by using a self-locking screw or an integrated Varactor diode. When using Mechanical tuning, if you bring a tuning screw close to the dielectric resonator, the resonant frequency can be modified.

In Electrical tuning or Varactor tuning, the DRO is coupled to a microstripline connected to the varactor, resulting in mutually coupled resonant circuits. Variation in bias voltage dependent capacitance of the varactor, varies the resonant frequency.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Dielectric Resonator Oscillators market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.

The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among the population, and uncertainty about future.

This report also analyses the impact of Coronavirus COVID-19 on the Dielectric
