Abstracts

Fetal heart rate monitoring is the process of using special equipment to measure and monitor the baby's heart rate and rhythm during delivery and delivery. Fetal heart rate monitoring is commonly used in obstetrics and gynecology. It is essential in fetal management, primarily at the time of delivery. Fetal heart rate monitoring during high-risk pregnancy reduces fetal or neonatal mortality and helps prevent severe neonatal asphyxia and Cerebral Palsy (CP) due to fetal hypoxia. In addition, it helps to detect and measure any changes in normal heart rate patterns during childbirth. Two types of techniques are used primarily for heart rate monitoring, including internal fetal heart rate monitoring and external fetal heart rate monitoring.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
