## **Abstracts**

This report studies the High Volume Low Pressure (HVLP) Spray Guns market. Spray gun is a small, air-operated tool that sprays various media including ink and dye, but most often paint by a process of nebulization. For low pressure spray gun, the paint container (being either gravity feed or suction feed) is placed under pressure forcing the paint material through the nozzle. A large volume of low pressure are is then intersected with the mainstream causing the atomization process. Because of the lowered pressure, the atomized paint has less bounce back. Less overspray, greater transfer efficiency. Thanks to the higher volume of material being displaced more of it end up on the surface where the gun is being aimed. This means you will save money on paint by using less of it. HVLP is one of the most efficient types of spray guns you can get. Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
