## Abstracts

The primary purposes for using stabilizers in ice cream are: to increase mix viscosity; to increase the perception of creaminess; to provide resistance to melting; to retard the growth of ice and lactose crystals during storage, especially during periods of temperature fluctuation; to prevent 'wheying off'; and to help prevent shrinkage during storage. Many of these functions are attributed to the enhanced viscosity of the ice cream mix.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
