Abstracts

The implantable Venous Access Port, also known as PORT in the clinic, is a professional infusion device that is placed in the body to reduce the vascular irritation of the drug. It is divided into three parts: a non-invasive needle (butterfly needle), a catheter placed in the subclavian vein, and an injection seat (port body) buried under the skin and connected to the infusion needle. The injection seat is connected to the catheter inserted into the subclavian vein to form a long-term vascular access, which acts like a port, so it is called an 'infusion port.'
