Abstracts

Isoflurane, sold under the trade name Forane among others, is a general anesthetic. It can be used to start or maintain anesthesia.[1] Often another medication is used to start anesthesia due to airway irritation with isoflurane. It is used by inhalation. Side effects include a decreased ability to breathe (respiratory depression), low blood pressure, and irregular heartbeat. Serious side effects may include malignant hyperthermia and high blood potassium. It should not be used in people with a history of malignant hyperthermia in either themselves or their family members. It is unknown if use during pregnancy is safe for the baby, but use during a cesarean section appears to be safe. Isoflurane is in the halogenated ether family of medication. Isoflurane was approved for medical use in the United States in 1979. It is on the World Health Organization's List of Essential Medicines, the most effective and safe medicines needed in a health system.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
