## **Abstracts**

This report focus on Laser Cladding Service market.

Laser Cladding makes use of the laser as a heat source to melt and weld onto a component a material that has different and beneficial metallurgical properties with the lowest chemical dilution possible for a welding process. This allows one to cost effectively customize the surface properties of less expensive substrate to provide greater resistance to corrosion, oxidation, wear and high temperature fatigue strength. With laser cladding, surface application is performed by melting of a material on a workpiece. Laser cladding is used for the upgrading of surfaces and to repair or modify components that cannot be replaced cost-effectively. Manual or automated processing is possible.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
