Abstracts

Liquid flow screed is self-levelling. No vibration is necessary to remove bubbles and densify the liquid mass. Due to the easy consolidation thickness can sometimes be reduced in comparison to conventional screeds. This minimises heat storage leading to a floor that reacts quickly to user requirement hence raising the efficacy of underfloor heating.

A liquid floor screed will have a more even surface than a hand laid semi-dry traditional screed and because it is denser sound is deadened and heat transfer speeded up. Better heat transfer (aka increased thermal conductivity) can be advantageous when underfloor heating is in place. Anhydrite screeds are even more thermally conductive than their cement equivalents.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
