## Abstracts

The milk modulators is also called a milk adjuster. The initial use is to warm the cold water to keep it suitable for the baby to drink, and to feed the baby with milk powder. The basic function of the milk modulator is constant water temperature, so it is also called constant temperature milk adjuster. In a general milk modulator, the electric heating body is separated from the water container, and the heating speed is slow, and it takes a long time to preheat. In the baby bottle heater, the electric heating body and the water container are connected to each other to improve heating efficiency and achieve rapid temperature adjustment. This milk conditioner is usually boiled and can be completed in a matter of minutes.
