Abstracts

Mortar is an adhesive, usually formed by mixing a cementitious material (cement or lime) and fine aggregate (sand and Sawdust) with water. Mortar is used to bind different components, such as stone and brick. A mortar mixer mixes cement, sand, and water to form mortar. The rotation of the drum in the mortar mixer is different from that of the drum mixer. The rotating oar of the stationary cylinder mixes mortar elements such as sand, cement, and water. The rotating blades are mounted on a shaft in the center of the barrel. Blades are equipped with rubber strips to scrape away mortar from the side of the barrel. A mortar mixer works well with a smooth mortar mixture as compared to a concrete mixture containing coarse aggregate. Mortar mixing equipment is mainly used in the construction industry. One of the important advantages of mortar mixing equipment is that it can save time and energy. Mixing mortar by hand is difficult and time-consuming. Mortar mixing equipment can make better use of time and focus on other aspects of the construction project.
