Abstracts

Optical surgical navigation system is mainly composed of a positioning marker, an optical positioning system, and a computer system. The surgical navigation system is an accurate match between preoperative or intraoperative image data and the patient's anatomy on the operating table, during surgery, the surgical instruments are tracked and the position of the surgical instruments is displayed on the patient image in real-time in the form of a virtual probe so that the position of the surgical instruments relative to the patient's anatomical structure is clear to the doctor, make surgery faster, more accurate, and safer.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
