Abstracts

Pellicle Beamsplitters are very thin nitrocellulose membranes bonded to lapped aluminum frames that feature no ghost images from second surface reflections. Pellicle beamsplitters are very thin, lightweight polymer membranes stretched and bonded over a flat aluminum frame. Due to the thinness of the membrane, images from secondary reflections are eliminated. In addition to this feature, pellicles technology is resistant to mechanical shock and climate variations, and also has multiple wavelength versatility. These are features that systems requiring beamsplitters may want to take advantage of, so to make it easier, pellicle beamsplitters include mounting holes underneath the frame for easier integration. High quality pellicles can be either uncoated or coated to produce a range of reflections necessary for various applications. Uncoated, high quality pellicles have a reflectivity of approximately 8 percent, and work well for applications, such as beam sampling. As opposed to uncoated pellicles technology, coated high quality pellicles produce equal reflectivity and transmission over a wide percentage of reflections.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Pellicle Beamsplitters market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
