## Abstracts

A phase-locked dielectric resonator oscillator (PLDRO) is a type of oscillator that is used in millimeter-wave communication systems, where phase noise performance is of utmost importance. As wireless communication systems are advancing, the system manufacturers and service providers are all trying to transmit more data within the limited frequency resources available. To do so, they are using more advanced modulation techniques such as 16PSK or 128QAM. Generally, the phase noise of the data modulation index and local oscillator are very closely related. Phase noise of the local oscillator must decrease as the modulation index increases.

The phase noise characteristics of a signal are determined by the oscillation method used to create the signal. Typically, a PLL-VCO (Phase Locked Loop-Voltage Controlled Oscillators) or a PLDRO (Phase Locked Dielectric Resonator Oscillator) is used. PLDRO's are most often used in high frequency microwave systems that require strict phase noise characteristics.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
