## Abstracts

Most of the initial cell culture reactors used bioreactor. Because of the difference in morphology and structure between plant cells and microbial cells, plant cells are larger than microbial cells, which are less tolerant to shear stress and require much less oxygen than microbial cells, therefore, bioreactor are not entirely suitable for plant cell growth and production. Many plant cells need light in the process of culture, and it is often considered to add light system on the basis of common reactor, but there are many problems in practice, such as installation and protection of light source, transmission of light and the influence of the illumination system on the reactor gas supply and mixing. External illumination is often used in small-scale experiments. The reactor surface has a transparent illumination area and the light source is fixed around the reactor. However, it is difficult to solve the problems of light transmission window and even light reception of internal culture in large-scale production, so plant cell photobioreactor is widely used.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Plant Cell Photobioreactors market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.

The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among the population, and uncertainty about future.
