Abstracts

This report mainly focus on Quench Coolers market. Quenching can either be used to directly control a chemical reaction or in the treatment of an emergency vent stream. For the direct quenching of a chemical reaction when loss of control has occurred, the quench material both cools and dilutes the reactants, thereby slowing down the reaction rate and the rate of heat generation to a controllable level. Quenching may be carried out by adding the quench liquid to the reactor or by discharging the reactants to a dedicated dump tank.

Quench systems are used in vent disposal systems for the treatment of streams that can not be discharged directly to atmosphere or where continuing reaction is taking place. The process involves the mixing of a solvent with the relief stream. This results in the condensation and removal of volatile components from the relief stream and / or the cooling of the vent stream which prevents further reaction from taking place.
