Abstracts

This report focus on Raise Boring Rig market.

A raise borer is a machine used in underground mining, to excavate a circular hole between two levels of a mine without the use of explosives.

Raise boring provides a safe means of excavating a circular hole between two levels of a mine without the use of explosives. A raise boring machine is set on a platform on the upper level to drill a small hole, known as the pilot hole, through to the cavity below. Once the drill has broken through, the pilot bit is removed and is replaced by a reamer head, of the desired diameter of the shaft, which is rotated and raised back toward the raise boring machine. The drill cuttings from the reamer head fall to the bottom of the hole and the reaming process creates a cylindrical hole with smooth walls.

Raise boring was developed for the underground mining industry but is nowadays increasingly also used on infrastructural projects to create tunnel ventilation or elevator shafts, and in sewer and water projects, to mention a few examples. Advances in the design and construction of reaming heads and rock tools means the technique can now be used in very hard rock and in deep underground locations. Due to its many advantages over the conventional drill and blast methods, raise boring continues to find new applications.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
