Abstracts

Recombinant human interferon protein (IFN- γ) is a bioactive protein primarily used for cell culture applications in many diagnostic laboratories. It is currently being used in many research activities such as immunology, oncology, stem cell research and virology. Recombinant human interferon proteins are not just limited to the process of discharging of reactive oxygen species. They are also involved in other growth functions such as bone growth and bone resorption. Recombinant human interferon protein is one of the recombinant proteins available currently, the only difference is that it is sourced from CHO-cell line. Common practice to such medium is associated with complications which might lead to failure in cell cultures. The status of recombinant human interferon protein is strictly regulated as it require strict temperature control, which is around -70°C or below for retaining full action activity. Recombinant human interferon protein is mostly available in beta and alpha form, though other forms have started emerging in the market.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
