## Abstracts

RF Phase Shifters are used to change the transmission phase angle of an input signal. Ideally phase shifters provide an output signal with an equal amplitude to the input signal, any loss here will be accounted to the insertion loss of the component. The input signal is shifted in phase at the output based on the configuration of the phase shifter selected. There are three main types of phase shifters:

**Digital Phase Shifter** – These phase shifters are digitally controlled. They are programmable or can be controlled via a computer interface. USB phase shifters are a relatively new form factor, which enables the phase shift of the device to be controlled from a computer.

**Analog Phase Shifter** – The phase shift in analog phase shifters is typically controlled by a voltage level. The phase shift change based on the tuning voltage is specified for the phase shifter.

**Mechanical Phase Shifter** – The phase shift of the device is controlled manually with a knob. The phase from the input to the output is adjusted by turning a knob.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the RF Phase Shifters market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.

The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among

the population, and uncertainty about future.
