Semiconductor packaging is conducted to guarantee protection to the wafer or substrate. The packaging is built from materials such as plastic, metal, glass or ceramic and is composed of one or more semiconductor electronic components.
Semiconductor packaging materials are base players of discrete semiconductor devices and integrated circuits on which other layers are deposited to complete the circuit.
Thinner core materials are ideally used to surro system applications.
The validation of lead substrates has increased in comparison to lead frames and bonding wires as the industry advances more towards leadless and cable-less packages.
The market will experience robust growth due to increased demand for smart mobile devices and electronic goods.
Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Semiconductor Package market in 2020.
COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.
The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among the population, and uncertainty about future.
This report also analyses the impact of Coronavirus COVID-19 on the Semiconductor Package industry.
