Abstracts

A septic aerator works by pumping oxygen into the tank changing it from an anaerobic atmosphere to an aerobic atmosphere and this allows the more effective aerobic bacteria to exist in the tank. Under these conditions the treatment in the tank is increased and effluent leaving the tank can be cleaner which in turn takes the load off the soil treatment area.

In a regular system the treatment process is started in the septic system. But because the tank is anaerobic (without oxygen) the treatment process is minimal. From there the effluent enters the drainfield where the uneven shape of the gravel or the open area of a chamber system creates voids that contain oxygen. In the presence oxygen aerobic bacteria exist and these bacteria are 20 times more aggressive than anaerobic bacteria. Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Septic Aerator market in 2020.

COVID-19 can affect the global economy in three main ways: by directly affecting production and demand, by creating supply chain and market disruption, and by its financial impact on firms and financial markets.

The outbreak of COVID-19 has brought effects on many aspects, like flight cancellations; travel bans and quarantines; restaurants closed; all indoor events restricted; over forty countries state of emergency declared; massive slowing of the supply chain; stock market volatility; falling business confidence, growing panic among the population, and uncertainty about future.
