Abstracts

Thermal imaging systems are like thermal cameras that can sense and identify any amount of difference in the temperature of the subject by calculating the infrared energy emitted by it. The images obtained are known as thermograms that are the visual display of the infrared energy emission amount as well as transmission and reflection quantity by an object. These systems consist of a camera that holds the capability of interpreting the data by performing algorithms in order to build an image and they work on the principle of natural phenomenon of radiant heat exchange which takes place all the time and everywhere.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency. The global impacts of the coronavirus disease 2019 (COVID-19) are already starting to be felt, and will significantly affect the Thermal Imaging Systems market in 2020.
